## JAVA

- **OOPS:** Abstraction , Encapsulation , Polymorphism , Inheritance.
- **JDBC:** Java–MySQL CRUD integration.
- **Exception Handling:** try-catch for SQL/input errors.
- **File Handling:** Upload images/reels via FileInputStream.
- **User Interaction:** Console-based menu system.

## DATABASE MANAGEMENT

- **Schema:** Tables for Users, FriendRequests, Messages, Image, Vedio, Likes, Saves.
- **Keys:** Primary/Foreign Keys for relationships.
- **Normalization:** Reduced redundancy.
- **CRUD:** Insert, Update, Delete, Select.
- **Joins:** For liked/saved reels & friend requests.

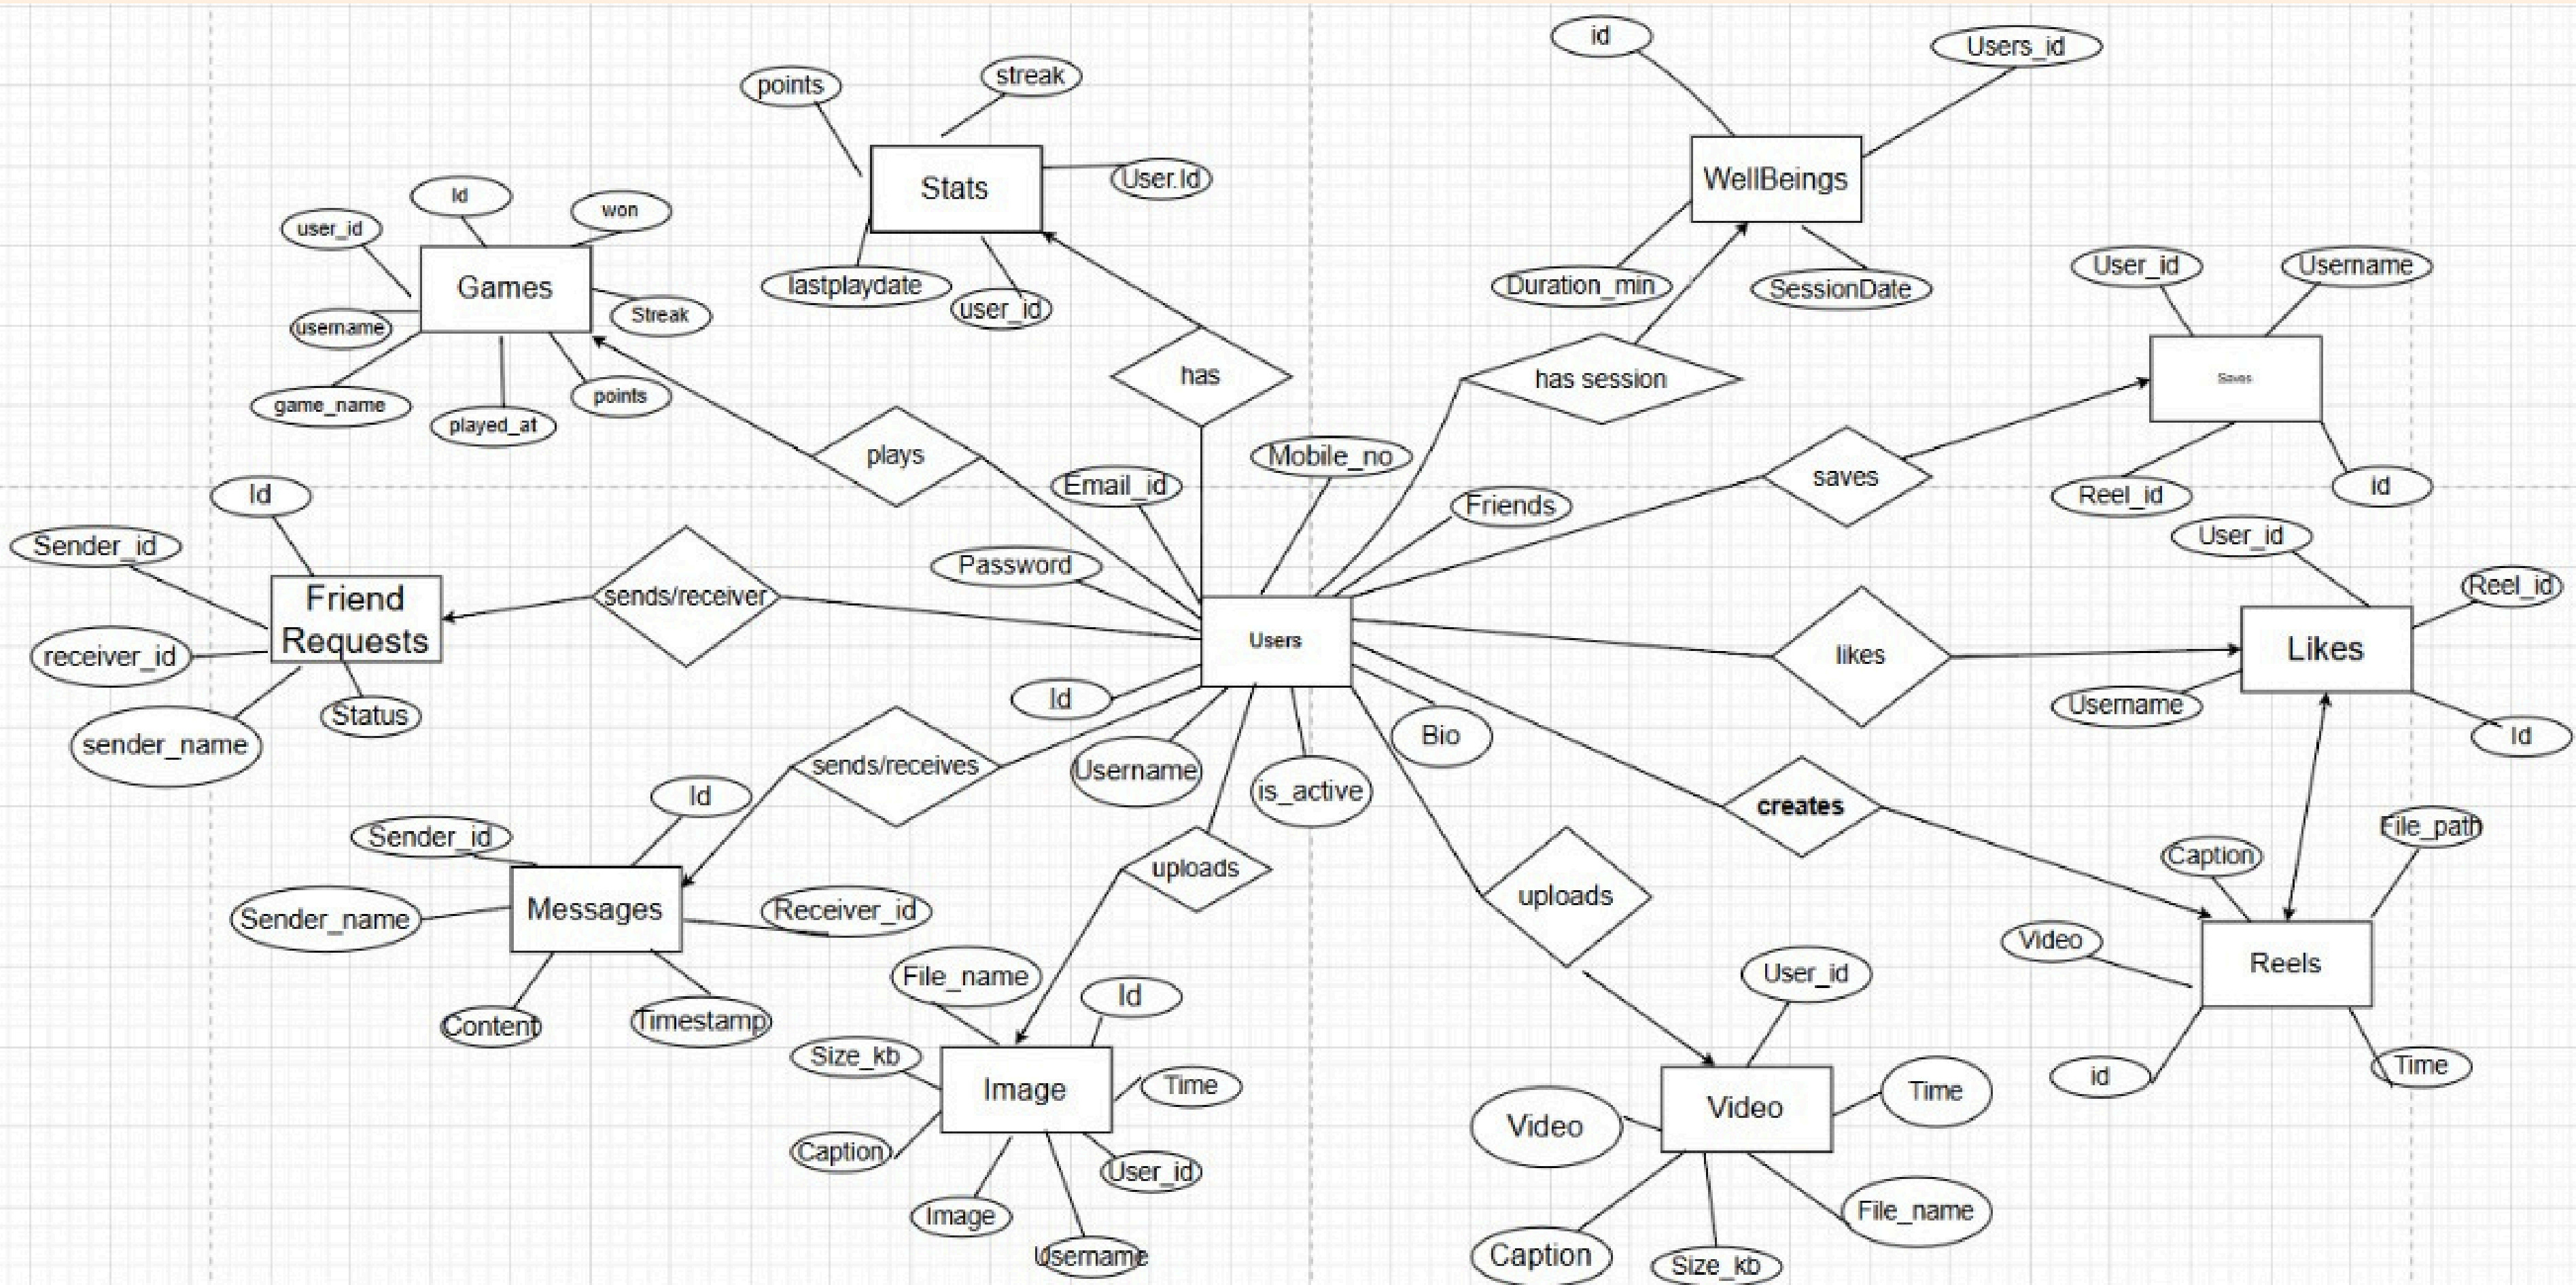

## DATA STRUCTURE

- **Linked List:** Stores inbox messages in order.
- **Queue:** Processes tasks/messages in FIFO.
- **Custom Classes:** Own Linked List & Queue (no built-ins).
- **Dynamic:** Grow/shrink as needed.
- **Efficient:** Fast insert/remove vs arrays.

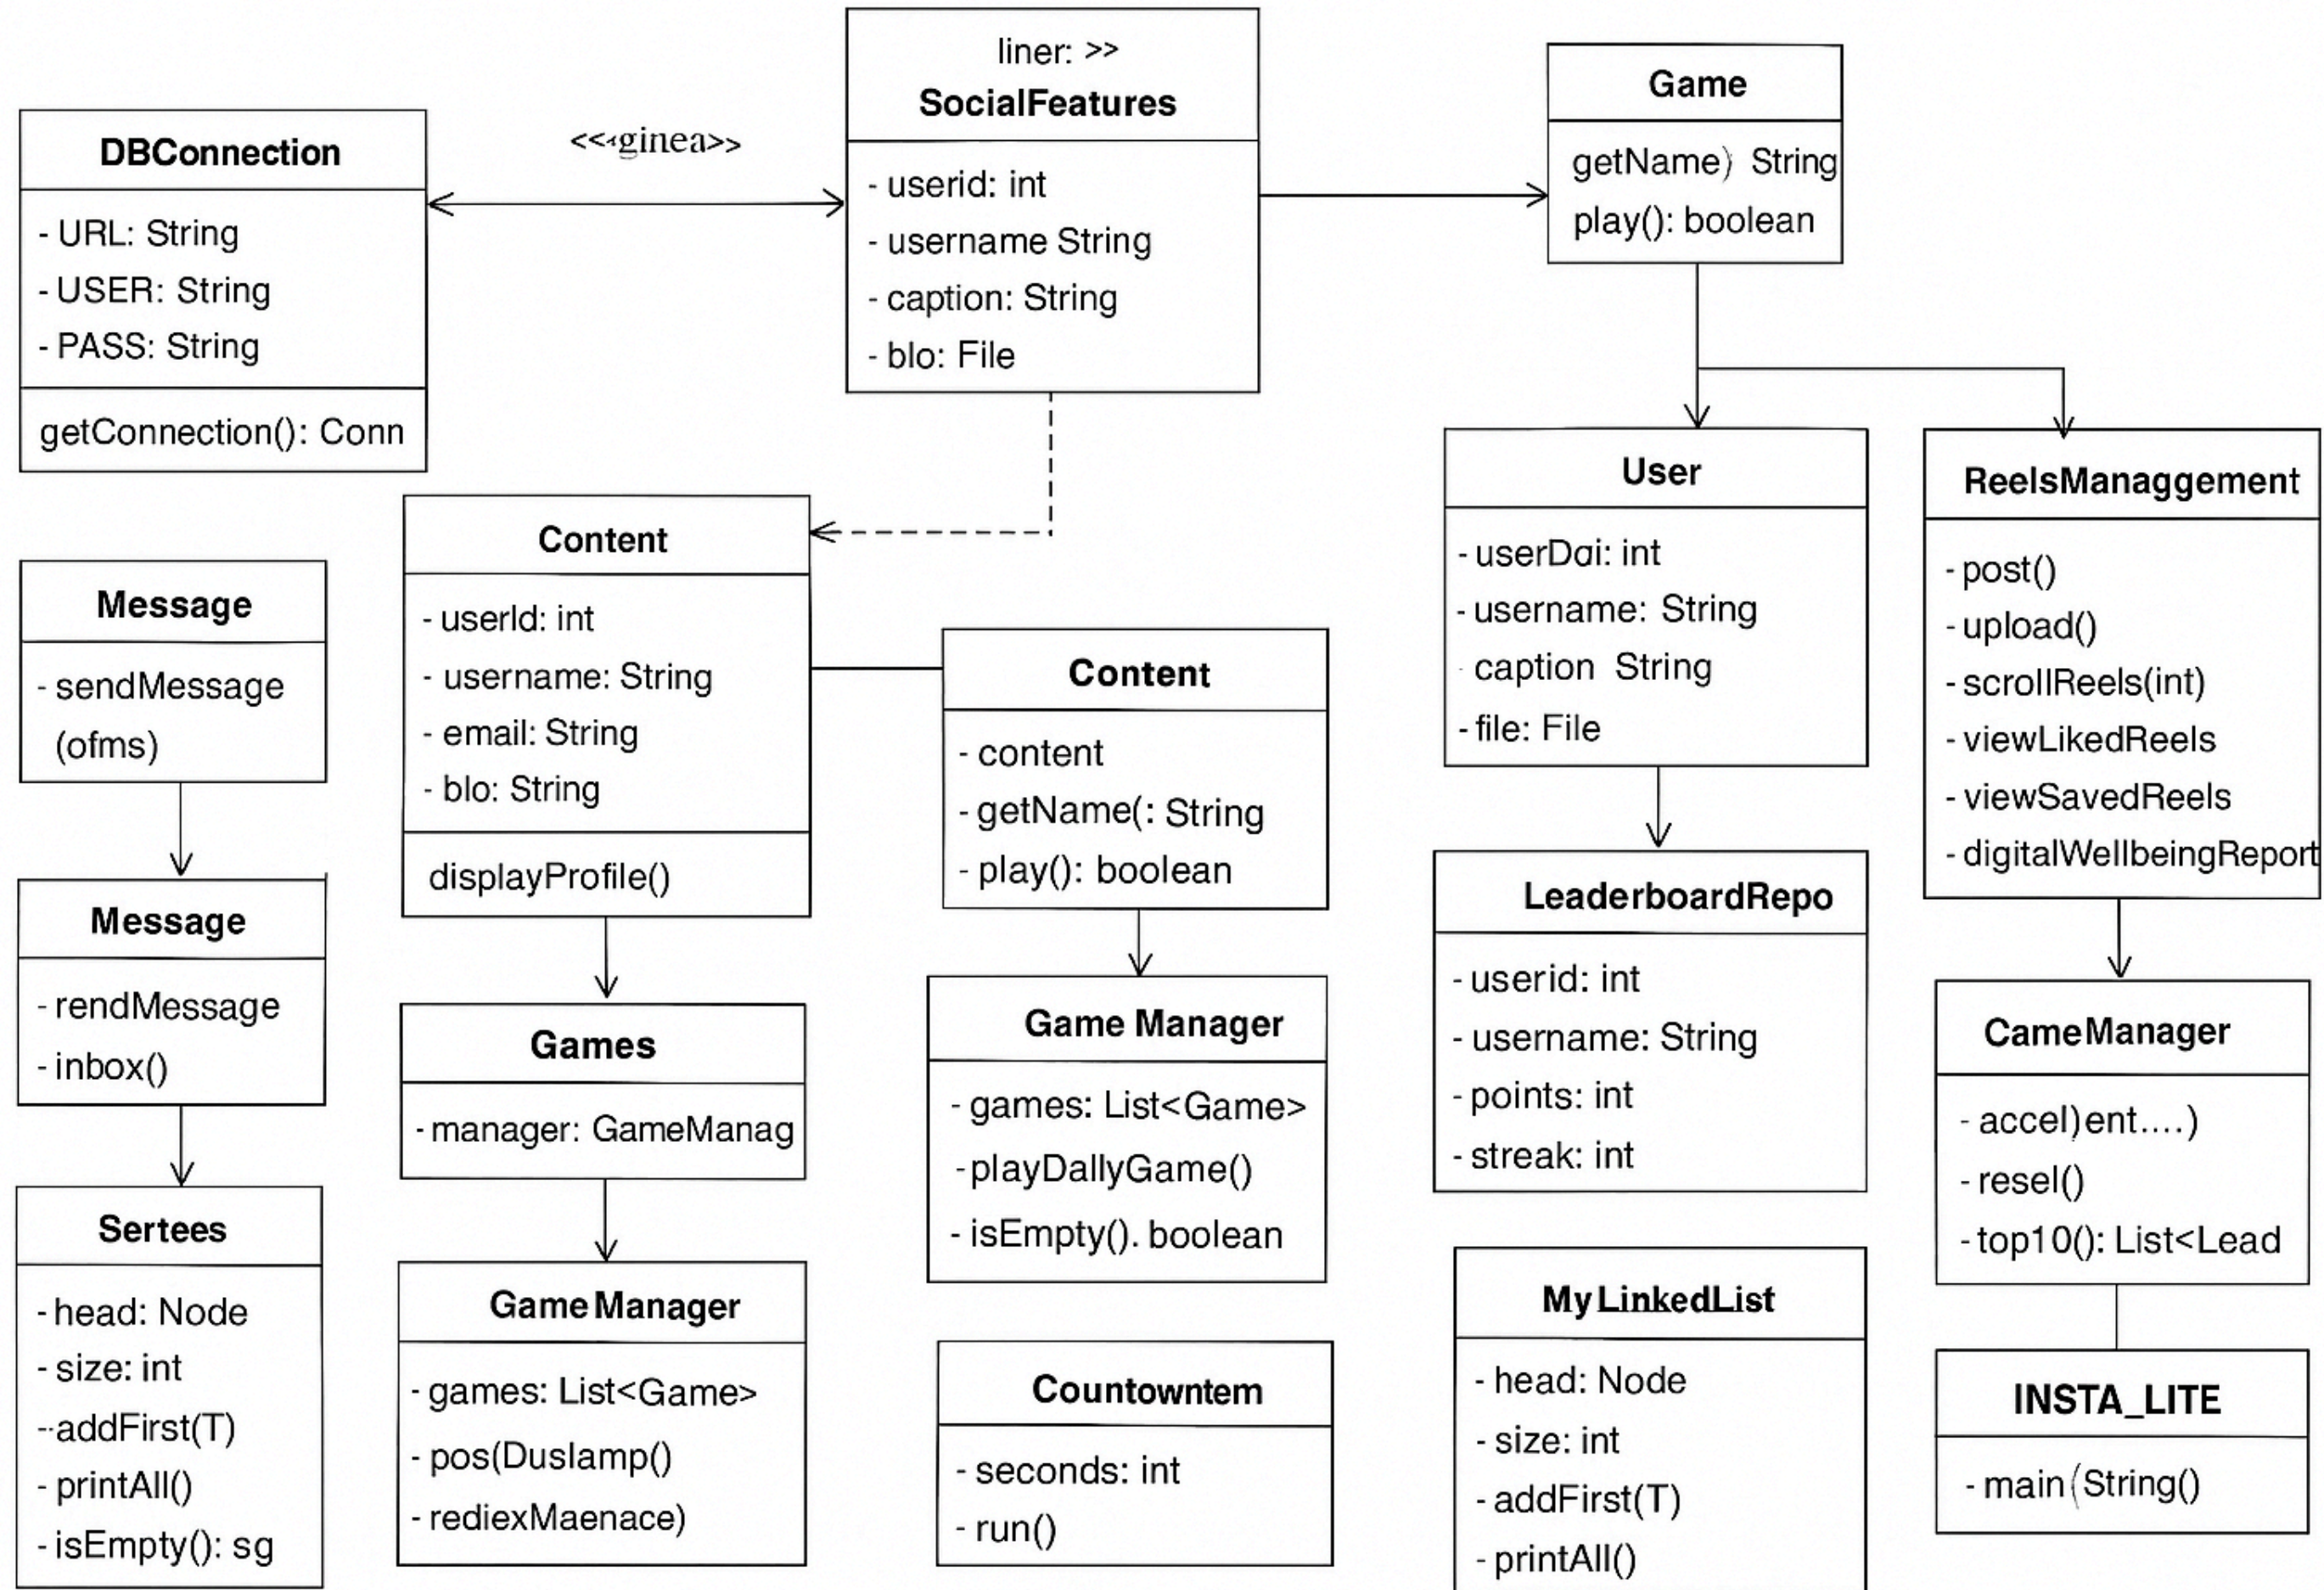

**ALL DATA WERE SEPARATELY STORED  
IN MYPHP ADMIN WITH INSTA\_LITE  
DATABASE AND RESPECTIVE TABLES .**

Data Structure

1

## Linked List

Used for inbox messages to store and display them in sequence , allowing easy insertion , updation without shifting elements

- **Messages arrive sequentially** → must preserve order.
- Linked List enables fast insertions.
- **Dynamic size** → grows as more messages arrive.
- Sequential access is enough (no random indexing needed).
- Ideal for inbox management.

# Used

## Data Structure

2

## Queue

Ensures Friend Request are processed in the same order they were sent (FIFO).

- Friend Request must be delivered and read in sent order.
- Queue follows FIFO (First-In-First-Out).
- Simpler than Stacks (reverse order) or Hash tables (no order).
- Fast and efficient for adding new and removing old messages.

# CHALLENGES

- Prevent duplicate likes/saves.
- Keep friend counts accurate.
- Handle SQL errors & invalid actions.
- Manage incorrect file paths on upload.
- Console Based don't Provide View Experience.
- Account Privacy for the User who dont want to Socailize them

# CONCLUSION

Insta Lite successfully demonstrates how core social media features can be implemented using Java, JDBC, and MySQL in a console-based environment. It provides essential functionalities such as account management, posting media, messaging, friend requests, and reel interactions, all backed by efficient data structures and database operations.

The project highlights how simple, well-chosen data structures like Linked Lists and Queues can make data handling efficient and intuitive. Overall, Insta Lite serves as a compact, functional model of a social networking platform while reinforcing key concepts of database connectivity, CRUD operations, and user interaction.

thank you!
